Background

- Tumours continually shed their DNA into the circulation
- Majority (>90%) of cervical cancer caused by human papillomavirus (HPV)
- Non-invasive liquid biopsy tests can detect HPV circulating tumor DNA (ctDNA) in the blood as a measure of disease burden
- Our pilot study showed detectable HPV ctDNA at the end of chemoradiation is associated with worse progression-free survival

Han et al, JCO Prec Oncol, 2018; 2:1-8
Leung, Han*, et al. Clin Cancer Res 2021; 5857-68*

Newer HPV ctDNA detection technologies

(A) Droplet-based digital polymerase chain reaction (dPCR)

Sample partitioned into thousands of nanoliter-sized droplets, each with independent amplification events

dPCR probes target E6 & E7 regions

(B) Next generation sequencing (HPV-seq)

Probes tiling the entire genome allow full coverage of HPV

Rostami, Bratman, Han. Clin Cancer Res 2021; 5158-60

Method

- Prospective multicenter validation study
- 70 patients with stage IB-IVA HPV+ cervical cancer treated with definitive (chemo)radiation between 2017-2022
- HPV genotype determined using baseline plasma sample with HPV-seq
- HPV genotype-specific plasma DNA levels quantified using dPCR & HPV-seq

Results: dPCR

End of chemoradiation (CRT)

ctDNA-negative	37	33	32	26	19	18	10	5	4	2
ctDNA-positive	25	19	16	11	7	6	3	2	1	0
	Numbers at risk									

4 – 6 weeks post CRT

ctDNA-negative	47	42	41	34	23	22	13	7	5	2
ctDNA-positive	13	8	5	3	2	1	0	0	0	0
	Numbers at risk									

3 months post CRT

ctDNA-negative	49	46	43	34	24	22	13	7	5	2
ctDNA-positive	18	12	7	5	2	2	0	0	0	0
	Numbers at risk									

— Undetectable HPV ctDNA — Detectable HPV ctDNA

Results: HPV-seq

End of chemoradiation (CRT)

4 – 6 weeks post CRT

3 months post CRT

Progression-Free Survival

ctDNA-negative	25	24	24	18	15	14	8	3	3	2
ctDNA-positive	37	28	24	19	11	10	5	4	2	0
	Numbers at risk									

ctDNA-negative	42	38	37	29	19	18	10	4	3	2
ctDNA-positive	18	12	9	8	6	5	3	3	2	0
	Numbers at risk									

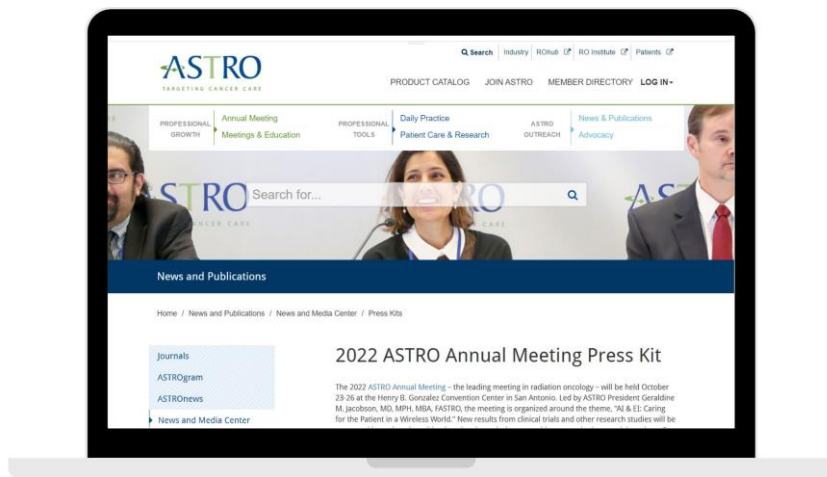

ctDNA-negative	46	43	42	33	21	20	10	4	3	0
ctDNA-positive	21	15	8	6	5	4	3	3	2	2
	Numbers at risk									

— Undetectable HPV ctDNA — Detectable HPV ctDNA

Conclusions

- HPV-seq enables determination of HPV type (genotyping) directly from plasma
- Persistent HPV ctDNA following chemoradiation is independently associated with inferior progression-free survival
- HPV ctDNA testing can be used to identify, as early as at the end of chemoradiation, patients at high risk of recurrence
