## Innovation for SRS Imaging and Treatment Solutions with Qfix Encompass™ and the Encompass

Building on the clinical success of Encompass, we continue to innovate and introduce solutions that enable new imaging and treatment workflows. Developed with MRI simulation in mind, the Encompass 15-Channel Head Coil is specifically designed to accommodate the high precision positioning that is unique to the Encompass MR SRS Immobilization System. The 15-Channel Head Coil offers adjustable geometry, allowing optimal coil placement close to the patient's anatomy to provide excellent homogeneity and image quality across the entire cranium. The Encompass 15-Channel Head Coil is compatible with select Siemens 3T MRI Systems and can be used with the Encompass MR SRS Immobilization System to obtain enhanced MR images for SRS treatment planning, including MR-only and MR fusion techniques.

The submillimeter immobilization of the Encompass SRS System is an integral part of a stereotactic radiosurgery program and has been used to treat patients around the world, including as a prerequisite for the Varian HyperArc™ high-definition radiotherapy delivery system.
